# **Research Interests**

My research focuses on the application of formal methods to the analysis and optimization of computational models, including software programs, VLSI circuits, and emerging technologies. Specifically, I am active in the following directions (tools which I have developed or contributed to are given in parentheses):

- Cross-application of hardware and software verification techniques (BTOR2C, BTOR2-CERT, and CPV)
- Development of new algorithms for software verification (CPACHECKER)
- Stochastic Boolean satisfiability and its application to probabilistic models (RESSAT and ERSSAT)
- Optimization and verification of threshold logic circuits (TLCOLLAPSEVERIFY)

The theoretical foundation of my work is algorithms and data structures, formal methods, mathematical logic, and system modeling. My goal is to invent new approaches for real-world applications with heterogeneous components. I also emphasize software engineering for tool implementation and reproducible evaluation.
